

It is my belief that allowing RFID devices such as that proposed in Section 15.240 by SAVI will be detrimental to use of the 425-435Mhz band by current Amateur Radio operators. Low power and weak signal operations will be significantly affected. The assertion that devices of this type will be constrained to commercial areas with no amateur radio traffic cannot be quantified in any usable manner, as most commercial shippers can and do enter non-commercial areas.

Radio transmissions emanating from a commercial area are also under no obligation to constrain themselves to the area in question and frequently propagate much further than the designers originally intend.

Please reconsider this change to current FCC rules.

Thank you.
